

# Webcast - Improvements in Consumer during state change

With today's release, we have improved the user experience in Consumer when the state of a Webcast changes (for example, between pre-live and live, or live and post-live).

With this change, the update happens without needing a full refresh of the Consumer page. The Webcast player and slides update automatically to reflect the new state. The update will happen at most 30 seconds after the change is requested in Webcast Operator.

Please note that use of the **Preview** button in Webcast Manager will immediately trigger a full refresh of Webcast Consumer, to ensure any configuration changes are properly applied.
