Webcast: Automatic switch to Post-Live state (Update)

Switching your event to post-live state is an important part of a Webcast: it marks the end of your live presentation, triggers the upload of the recorded event to VideoManager Pro, and presents the recorded event to viewers who may have arrived late and missed some parts of the live event.

In case you forget to make this switch, Webcast will automatically transition the event to post-live state approximately **one hour** after the end time (base on the moment the event was started)
Note: This new logic is an update of the previous implementation that was announced in this Release Note (on 28 May 2020).

More information is available in the Webcast Manager documentation.
